

METRO NEUROLOGY & SPINE SPECIALISTS

Advanced Diagnostics | Surgical Follow-up | 90210 Specialists Row

PATIENT: John Doe

DATE OF VISIT: June 15, 2026 (6-Week Post-Op)

SURGICAL PROCEDURE: L4-L5 Microdiscectomy (05/12/26)

NEUROLOGICAL STATUS POST-SURGERY

Patient reports significant resolution of the "electric shock" sensations in the left lower extremity. However, he continues to describe a **persistent "dead" feeling** in the lateral aspect of the left foot and calf.

Clinical Findings: Sensory testing reveals persistent hypoesthesia in the L5/S1 dermatome. Motor strength for ankle dorsiflexion remains 4/5 on the left. Hoffman's sign remains positive.

IMPRESSION: Status-post decompression. Chronic axonal damage is noted, likely sustained during the entrapment period. While the structural impingement has been removed, the neurological deficit is considered **permanent**. Patient is assigned a 5% Whole Person Impairment (WPI) rating per AMA Guides, 6th Ed.
