

METRO PHYSICAL THERAPY

REHABILITATION PROGRESS NOTES

Patient: John Doe | **Therapist:** Mark Motion, DPT

SESSION #5 (03/28/2026):

Intervention: Therapeutic exercises, core stabilization (Pelvic tilts), and TENS unit application to lumbar region.

Response: Patient tolerated 15 mins of light stretching but requested to stop due to **acute radicular symptoms** radiating to left foot. Functional mobility remains severely limited by pain-avoidant gait.

SESSION #6 (03/31/2026):

Intervention: Lumbar traction, gait training, and education on "Neutral Spine" mechanics.

Response: Observed "Foot Drop" during gait assessment. Strength in Left Hallux extension is **3/5**. Patient expresses frustration with lack of functional improvement. Recommended hold on further PT pending specialist intervention (ESI/Surgical).

Note: Patient subsequently entered a period of clinical withdrawal; follow-up scheduled but not attended.
