

## NEUROPSYCHOLOGICAL EVALUATION

Confidential Medical Record | Provider: Dr. Mindy Health, PhD

PATIENT: John Doe | DATE: April 18, 2026  
**CLINICAL INTERVIEW & TRAUMA HISTORY**

Patient was evaluated for acute psychological distress following a commercial vehicle T-bone collision involving mechanical extrication. Patient reports significant anxiety when viewing his facial scarring.

**DIAGNOSIS: Post-Traumatic Stress Disorder (F43.10) with Acute Dissociative Withdrawal.**

### EXPLANATION OF TREATMENT INTERRUPTION

Regarding the 14-day cessation of medical contact (04/01-04/15): This period is consistent with the patient's **Dissociative Withdrawal phase**. Following the removal of initial sutures, the patient experienced a severe psychological reaction to his cosmetic disfigurement. The "gap" was not an indicator of healing, but rather a profound psychological barrier preventing social reintegration and treatment compliance.
